Android Development for Beginners

The app will teach the user the basics of audio. The five things taught will be:

1. How sound travels
2. What is an equalizer in relation to audio.
3. What is compression?
4. What is feedback?
5. What is a sample rate?

I work as an audio engineer. I often find that many people are interested in sound but don't understand what it is, or what the tools in the realm of sound are used.

Thus, I think this app would be helpful in educating people in quick and easy way, using images and text and some light humor.
